## ABSTRACT

As hybrid work becomes the defining structure of contemporary organizations, understanding how leadership affects employee engagement is both timely and critical. This conceptual paper extends Leader-Member Exchange (LMX) theory to address the relational and motivational complexities experienced by employees in hybrid work environments, with particular reference to the organizational context of WeWork—a global co-working firm characterized by flexible and digitally mediated work practices. Building on Kahn's theory of employee engagement, the paper introduces a theoretical extension of LMX to hybrid settings, emphasizing how leader-member relationships are enacted and sustained across virtual and physical boundaries. It is proposed that the quality of these exchanges—mediated through digital communication and hybrid interaction—plays a central role in fostering the core relational dimensions of high-quality LMX: affect, loyalty, contribution, and professional respect. By situating LMX within the temporal, spatial, and technological realities of hybrid work, this paper contributes to the theoretical advancement of LMX by situating it within contemporary hybrid work paradigms and offers implications for leadership development aimed at enhancing engagement among distributed and digitally connected workforces. Methodologically, this conceptual extension will be informed by a systematic literature review on LMX and employee engagement within hybrid work environments, synthesizing prior empirical findings to derive theoretical propositions. Future empirical validation is envisioned through a quantitative research design, analyzing with a quantitative survey study to statistically assess the proposed framework.

**Keywords:** Leader-Member Exchange (LMX), Employee Engagement, Hybrid Workplaces.

## 1. INTRODUCTION

Hybrid work – a flexible model blending remote and on-site work – has rapidly shifted from a niche practice to a mainstream paradigm in the post-pandemic era. Global workforce data between 2023 and 2025 show a sustained expansion of hybrid arrangements across industries and regions. Surveys indicate that over half of all employees in many countries now work remotely at least part of the time, with one 2023 study finding 34% of employed adults in a hybrid schedule and an additional 22% fully remote (Deloitte, 2025). By early 2024, an estimated 100 million workers globally were on hybrid schedules. This surge reflects a post-pandemic normalization of flexible work models, as organizations seek to balance in-person collaboration with remote work's advantages (Robinson, 2024). Indeed, multiple surveys report that a majority of remote-capable employees prefer a hybrid arrangement over a full return to office. Hybrid work has thus become a defining structure of contemporary organizations, reshaping traditional notions of when and where work is performed (Barrero et al., 2023).

As hybrid work proliferates, co-working workspace providers like WeWork have emerged as key enablers in the new ecosystem. WeWork – founded in 2010 – grew into one of the world's largest co-working companies, and its global presence and service offerings uniquely position it to support hybrid work dynamics at scale. As of 2024, WeWork maintains roughly 600 locations worldwide, offering ready-to-use office facilities, shared workspaces, and meeting rooms on flexible terms (Catacora, 2024). This extensive global footprint provides organizations with the physical infrastructure to complement their digital workplaces. In practical terms, WeWork's network allows companies operating hybrid models to establish “hub-and-spoke” strategies or distributed offices without long-term leases – employees can collaborate in person at a convenient WeWork site when needed, while working remotely otherwise. The availability of on-demand workspace bridges the gap between home and a centralized office, giving hybrid teams the benefits of occasional face-to-face interaction,

<sup>1</sup>Corresponding Author: Level 10, Menara Razak, Universiti Teknologi Malaysia, Jalan Sultan Yahya Petra, 54100 Kuala Lumpur, Malaysia. TEL: (86)13425155514 Email: zhuzining@graduate.utm.my

networking, and a professional environment, without the cost and rigidity of dedicated offices. For example, WeWork offers enterprise membership programs like WeWork All Access, which give employees of client companies access to any WeWork location worldwide. This is particularly appealing to firms downsizing their permanent offices; by leveraging WeWork, they can still provide employees with office amenities and collaborative space on demand.

Hybrid work arrangements have become a cornerstone of organizational structures globally, transforming traditional notions of leadership and employee engagement (Kristanto & Mansur, 2025). As businesses increasingly adopt hybrid models—characterized by a flexible blend of remote and on-site work—the applicability of traditional leadership theories, such as Leader-Member Exchange (LMX), is challenged. Originally designed around direct face-to-face interactions, LMX theory now faces significant complexities within hybrid environments, where leader-member exchanges are mediated through digital platforms and intermittently supported by physical interactions (Varma et al., 2022).

The primary research problem addressed by this conceptual paper is the current theoretical gap regarding how LMX relationships manifest, evolve, and sustain in hybrid work contexts. Traditional LMX theory does not fully capture the nuances introduced by digitally mediated interactions and flexible spatial boundaries, leaving a critical knowledge void in understanding and optimizing employee engagement (De Alwis et al., 2022). Consequently, the relational dimensions integral to employee engagement—namely affect, loyalty, contribution, and professional respect—require re-examination and adaptation to remain effective in a hybrid work paradigm. To bridge this gap, this paper aims to extend the LMX theory within hybrid work contexts, integrating key insights from Kahn's theory of employee engagement. The objective is to conceptualize and articulate how digital and hybrid interactions influence LMX relationships and their subsequent impact on employee engagement. Through this theoretical integration, the paper seeks to establish a framework that not only advances academic discourse but also offers practical guidelines for leaders to cultivate high-quality exchanges across digital boundaries.

This research carries significant potential implications. Academically, it enriches the existing literature by providing innovative theoretical contributions that address the contemporary realities of hybrid work environments. Practically, it equips organizational leaders and human resource practitioners with actionable insights and strategies for enhancing employee engagement through effective hybrid leadership practices.

## 2. LITERATURE REVIEW

The rapid shift toward hybrid workplace models has necessitated a reevaluation of existing leadership theories, particularly concerning how leader-member interactions are maintained and enhanced within these contexts. This systematic literature review synthesizes recent research from 2022 to 2025, to comprehensively examine Leader-Member Exchange (LMX) theory, Kahn's theory of employee engagement, and the role of relational leadership in hybrid workplaces. The review seeks to identify theoretical developments, empirical findings, and practical implications relevant to sustaining effective leader-member exchanges and employee engagement in increasingly prevalent hybrid work environments.

### 2.1 Leader-Member Exchange (LMX) in Hybrid Work Contexts

LMX theory posits that leaders form differentiated relationships with subordinates, ranging from high-quality exchanges (characterized by trust, mutual respect, and obligation) to lower-quality, more transactional ones (Wang et al., 2024). In traditional co-located settings, high LMX is linked to numerous positive outcomes (e.g. job satisfaction, commitment, performance). Recent scholarship has begun to examine how these dynamics evolve in hybrid and digitally mediated workplaces. Varma et al. (2022) argue that the shift to remote and hybrid work fundamentally alters the development of LMX, since relationships that typically deepen through in-person interaction must now rely heavily on digital communication. There is concern that digital communication can hinder the formation of deeper leader-member relationships, as the richness of face-to-face cues is reduced. In other words, aspects like informal hallway conversations or spontaneous bonding – long seen as seeds of high LMX – are scarcer in virtual settings (Eslamdoust et al., 2024). At the same time, Herttua (2024) notes that hybrid work might present opportunities to level the playing field in leader-member relationships; when all team members connect through the same digital channels, leaders may engage more uniformly, potentially reducing favoritism or bias in relationship quality. Overall, the literature suggests that maintaining high-quality LMX in hybrid contexts requires conscious effort. Leaders must proactively recreate avenues for trust-building and personal connection in the absence of daily in-person contact, recognizing that relationship development will not occur as organically as before. High LMX is still attainable in hybrid teams, but it is neither automatic nor guaranteed by proximity- rather, it hinges on how leaders adapt their relational behaviors (Herttua, 2024).

Empirical studies from 2022 onward reinforce the continued importance of LMX in the new world of work. Reduced isolation is likely one mechanism linking LMX to engagement – a supportive leader who maintains regular contact can fulfill employees' social needs even when they work apart, thereby keeping them more connected and engaged with the organization (Petrilli et al., 2024). In fact, LMX was a stronger predictor of engagement than even employees' general sense of workplace belonging, highlighting the pivotal influence of the leader-member bond on keeping employees absorbed and energized in their work (Lartey, 2022). This finding resonates with core LMX theory – when employees feel they are in the leader's "inner circle" and enjoy

high trust and support, they are more likely to invest their full selves in job roles (Nagori & Lawton, 2024). High LMX may engender engagement by fostering mutual respect (e.g. leaders empowering and valuing input) and by fulfilling psychological needs for support and recognition. On the flip side, if LMX is poor in a hybrid context, engagement may suffer: low-quality exchanges could leave remote employees feeling ignored or mistrusted, which can lead to disengagement. In sum, recent empirical insights underscore that LMX remains a critical driver of positive employee attitudes and behaviors under hybrid work conditions, much as it has been in traditional settings. However, because the context of interaction has shifted, scholars call for rethinking how LMX is cultivated and sustained when much of the exchange occurs via emails, chats, and video calls rather than in person (Jungst et al., 2022). The consensus is that strong leader–member relationships do not automatically emerge in hybrid work – they must be intentionally nurtured through adaptive leadership practices that compensate for the loss of physical proximity (Yuan et al., 2023).

## **2.2 Kahn's Theory of Employee Engagement in Hybrid Workplaces**

William Kahn's (1990) theory of personal engagement provides a foundational lens for understanding how employees connect with their work roles. Kahn defined engagement as the harnessing of one's full self in work, manifest as physical, cognitive, and emotional vigor in performing job tasks. Although Kahn's original study long predates hybrid work, its insights remain highly pertinent: in any context, employees are more engaged when their work feels meaningful, their environment is trusting and safe, and they have the energy and support to immerse themselves in their roles (Kossyva et al., 2023). Crucially, Kahn's emphasis on the interplay between individuals and their work environment is especially relevant in hybrid settings, where the environment itself is redefined to include both virtual and physical spaces (Harunavamwe & Kanengoni, 2023).

Recent work has started to explore how hybrid and remote arrangements influence the psychological conditions for engagement. One consistent theme is that hybrid work can simultaneously offer benefits and pose challenges to engagement, depending on how it is implemented (Kumari et al., 2024). On the positive side, Naqshbandi et al. (2023) found that a well-structured hybrid work model had a significant positive effect on employees' work engagement, which in turn mediated improvements in job performance and job happiness. In their survey of hybrid workers, engagement was the mechanism translating the benefits of hybrid work into tangible outcomes, suggesting that when hybrid work is executed effectively, it can foster higher engagement by meeting employees' needs for flexibility, focus, and autonomy. This aligns with Kahn's notion of meaningfulness – employees feel more valued and empowered when they have some choice in how and where they work, leading them to invest more of themselves in their job tasks.

On the other hand, the challenges of hybrid and remote work can threaten the conditions for engagement if not properly managed (Haas, 2022). During the early pandemic period, many organizations noted a dip in engagement as employees struggled with abrupt remote setups. Pass and Ridgway (2022) reported an 11% drop in overall employee engagement during the COVID-19 lockdowns, with only a partial rebound afterward, leaving engagement levels still below pre-pandemic norms. This decline is attributable to factors that map onto Kahn's conditions: for example, employees suddenly working from home often faced diminished psychological safety, feeling disconnected from colleagues and unsure if their contributions were noticed, while also lacking the social support that in-office interaction provides. Thus, applying Kahn's theory in hybrid contexts directs attention to creating an environment where employees still experience meaning, safety, and support despite the physical distances.

In sum, Kahn's engagement framework provides a valuable conceptual bridge for integrating LMX with hybrid work dynamics. His focus on the individual's experience (meaningfulness, safety, availability) complements the relational focus of LMX. High-quality leader–member exchanges likely amplify all three engagement conditions: a trusted leader makes work feel more meaningful and safer, and provides resources that keep employees feeling able to engage. The challenge for organizations is to extend Kahn's engagement principles into the design of hybrid work practices, so that even when employees are geographically dispersed, they still feel psychologically present and connected. This entails crafting work arrangements and leadership approaches that maintain employees' line-of-sight to purpose, provide psychological security, and sustain personal energy – all of which are integral to engagement.

## **2.3 Relational Leadership Practices in Hybrid Workplaces**

The move toward hybrid work has underscored the importance of relational leadership – that is, leadership approaches centered on trust, communication, and the quality of relationships – as a driver of team effectiveness (Mustajab, 2024). In hybrid settings, where employees alternate between remote and face-to-face interactions, leaders cannot rely solely on traditional supervisory tactics or ad-hoc office encounters to lead effectively. Instead, intentional relational practices are needed to cultivate trust and open communication channels across distance, thereby supporting strong LMX and employee engagement (Buła et al., 2024). A consistent finding in the emerging literature is that trust is both more challenging and more crucial in hybrid teams. Without daily in-person visibility, leaders must trust their employees to work productively out of sight, and employees must trust that their managers will treat them fairly and support them, regardless of location. Artinger et al. (2025) observed that many leaders felt “uncertain of their influence” after their teams went fully remote, and this uncertainty can strain the trust between leaders and team members if not addressed. Building and sustaining trust thus becomes a deliberate endeavor – leaders need to demonstrate reliability (following through on promises), openness, and empathy in their interactions, to reassure remote staff that ‘out of sight’ does not mean ‘out of mind’.

Effective communication is the second pillar of relational leadership in hybrid workplaces. Researchers emphasize that hybrid leaders must be highly intentional in how they communicate with their teams. Regular, transparent communication helps counteract the physical distance by keeping employees informed and emotionally connected (Zhu, 2025). In practice, this might mean leaders explicitly invite team members to voice concerns or ideas and perhaps systematize feedback processes (e.g. virtual office hours, regular one-on-one video meetings) so that communication becomes a two-way street. Other studies echo that structured communication norms – such as clearly defining expectations for responsiveness, setting up team collaboration rituals, and leveraging multiple media (chat, video, phone) – are associated with better team cohesion and engagement in hybrid settings (Maritsa et al., 2022). By contrast, a lack of communication or irregular contact can quickly lead to remote employees feeling isolated or ‘in the dark’, undermining both the LMX relationship and the employee’s engagement (Montañez, 2024).

Empirical research in hybrid contexts supports this linkage: teams led by inclusive, communicative leaders report feeling more connected and engaged, even when working apart (Lartey, 2022). In contrast, hybrid teams suffer when leadership is purely task-focused or when communication lapses; under such conditions, trust erodes and disengagement can follow. Relational leadership also involves adapting management styles to individual needs, which is particularly salient in hybrid work (Ebojoh & Högberg, 2024). Some employees may require more frequent interaction or reassurance when remote, while others may thrive with greater autonomy – a savvy relational leader adjusts accordingly, maintaining the right balance of guidance and empowerment for each member. By doing so, leaders uphold each employee’s sense of being valued (driving engagement) while also reinforcing the loyalty and affect that underpin high LMX (Neal, 2024). The literature consistently shows that when leaders invest in relationships – through trust-building actions and open communication – they not only improve LMX quality but also engender higher employee engagement, creating a more resilient and high-performing hybrid work environment.

#### **2.4 Hypothesis Development**

Recent studies from 2022 to 2025 emphasized that high-quality Leader–Member Exchange (LMX) remained a key driver of employee engagement in hybrid work settings. Research highlighted the importance of intentional trust-building, consistent communication, and personalized support in sustaining effective leader–member relationships across digital and physical boundaries. As organizations transitioned into hybrid work models, the mechanisms through which leaders influenced employee engagement required reconsideration. LMX theory, which emphasized relationship quality between leaders and subordinates, remained a foundational framework but demanded adaptation to digitally mediated environments (Varma et al., 2022). In such contexts, trust-building became essential, as physical distance eliminated informal cues that traditionally fostered relational depth. Empirical findings affirmed that consistent, reliable leader behavior significantly predicted high-quality LMX in hybrid teams (Herttua, 2024; Petrilli et al., 2024). Therefore, the following hypothesis was tested:

**H1:** Trust-building between leaders and employees was positively associated with the quality of LMX in hybrid work settings.

Second, clear and frequent communication was central to psychological safety, a core condition for engagement as theorized by Kahn (1990). In hybrid environments, where face-to-face interactions were limited, intentional communication mitigated ambiguity and fostered connection (Zhu, 2025). Studies showed that structured and transparent communication enhanced employee engagement across distributed teams (Lartey, 2022; Artinger et al., 2025). Hence, the second hypothesis tested was:

**H2:** Frequency and clarity of leader–employee communication were positively related to employee engagement in hybrid workplaces.

Lastly, while high LMX correlated with greater engagement, its impact appeared contingent on the degree of personalized leadership support. In hybrid work, tailored feedback and responsiveness to individual needs reinforced psychological meaningfulness and amplified relational bonds (Ebojoh & Högberg, 2024; Neal, 2024). Therefore, the third hypothesis examined was:

**H3:** Personalized leadership support moderated the relationship between LMX quality and employee engagement, such that the relationship was stronger when perceived support was high.

### **3. METHODOLOGY**

This study adopts a quantitative research design aimed at examining the relational influence of leader behaviors—specifically trust-building, communication clarity, and personalized support—on the quality of Leader–Member Exchange (LMX) and employee engagement in hybrid workplace environments. The methodological approach is grounded in positivist epistemology and employs a deductive strategy to test the three hypotheses derived from the literature review.

#### **3.1 Research Design**

The empirical phase of the study utilized a structured questionnaire (Appendix One), which was administered to a purposively selected sample of hybrid employees. The research setting was WeWork, a global co-working organization that exemplified the hybrid workplace model. This site was intentionally chosen to ensure contextual relevance to the study. The focus was placed on measuring employees’ perceptions of leadership behaviors and their associations with LMX and engagement outcomes.

### 3.2 Sampling and Data Collection

The study engaged a purposive sample of 20 participants who were involved in hybrid work arrangements at WeWork China on May, 2025. The choice of 20 participants was methodologically consistent with best practices in exploratory and pilot studies, where sample sizes between 10 and 30 are often deemed sufficient for assessing feasibility and identifying preliminary patterns (Bujang et al., 2024). This sample size also reflected pragmatic considerations related to access, resource availability, and the exploratory nature of the study. Given the dynamic, transient character of co-working environments such as WeWork, a smaller, focused sample allowed for richer context-specific data collection while maintaining logistical feasibility (Ahmed, 2024).

Moreover, the primary research objective is to examine individual-level perceptions of leader–member exchange and engagement under hybrid work conditions, for which in-depth but manageable samples are appropriate. This approach aligns with precedent in empirical studies on relational leadership in digitally mediated settings, where smaller samples have yielded meaningful insights (Wang et al., 2022).

A purposive sampling strategy is employed to recruit 20 participants who are actively engaged in hybrid work arrangements at WeWork. Inclusion criteria require participants to have at least three months of experience working under a designated team leader or supervisor. Data is collected via paper-based questionnaires. Participation is voluntary, and responses are anonymized to ensure confidentiality and encourage openness.

### 3.3 Instrumentation

This study employed a structured questionnaire to investigate five interrelated constructs central to leadership effectiveness and relational quality in hybrid work environments: Leader Trust-Building, Leader Communication, Personalized Leader Support, Leader–Member Exchange (LMX) Quality, and Employee Engagement. Each construct was measured using a 5-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree), with survey items adapted from established, peer-reviewed instruments and conceptually tailored to the hybrid workplace context. To ensure theoretical rigor, the study integrates the multidimensional framework of LMX developed by Liden and Maslyn (1998), which delineates four foundational dimensions of the leader–member relationship: Affect, Loyalty, Contribution, and Professional Respect. These dimensions were analytically mapped to three core leadership behaviors—trust-building, communication, and personalized support—creating a comprehensive and empirically grounded model of relational dynamics in digitally mediated and spatially flexible work settings (Zhu, 2025).

Leader Trust-Building is posited as the relational anchor for cultivating Loyalty and Professional Respect within the LMX dyad. In hybrid contexts where informal, spontaneous interactions are diminished, trust becomes especially critical. Consistency in leadership behavior, follow-through on commitments, and fairness across both remote and in-person engagements are instrumental in reinforcing employees' perceptions of integrity and relational equity (Petrilli et al., 2024; Varma et al., 2022; Yuan et al., 2023). Empirical studies affirm that such behaviors foster reciprocal loyalty and deepen professional admiration (Sue-Chan et al., 2011).

Leader Communication functions as a key enabler of both Affect and Contribution. Effective communication—characterized by clarity, timeliness, and regularity—has been shown to strengthen emotional connections between leaders and subordinates, even in the absence of physical proximity (Zhu, 2025). Moreover, it facilitates mutual task alignment, supports goal attainment, and encourages employees to exceed formal role expectations, thereby activating the Contribution dimension of LMX (Wagner & Koob, 2022; Lartey, 2022).

Personalized Leader Support is conceptualized as a cross-cutting construct that enhances all four LMX dimensions through adaptive, employee-centered leadership behaviors. By recognizing individual preferences and tailoring support to diverse work styles, leaders promote psychological safety, personalized recognition, and developmental affirmation (Wang et al., 2023; Ebojoh & Högberg, 2024). This, in turn, not only reinforces Affect, Professional Respect, and Contribution, but also strengthens Loyalty by signaling care and attentiveness to employee well-being.

The incorporation of LMX Quality and Employee Engagement items further extends the conceptual model by capturing employees' holistic perceptions of relational alignment and intrinsic motivational states. Specifically, LMX Quality is assessed through perceptions of relational understanding and working alliance across hybrid conditions (Greimel et al., 2023), while Engagement is measured in terms of emotional connection and psychological safety in both digital and physical interactions (Qin, 2024).

Collectively, the questionnaire items were systematically reviewed and refined to ensure construct validity, contextual relevance, and conceptual integration. The instrument draws upon validated scales from recent literature (2018–2024), and modifications were made to reflect hybrid-specific conditions such as asynchronous communication, digital mediation, and physical dislocation. This methodological approach ensures the reliability and applicability of the survey for assessing leadership dynamics and engagement outcomes in contemporary hybrid work environments such as WeWork.

### 3.4 Data Analysis

The collected data is analyzed using SPSS. Descriptive statistics (mean, standard deviation) is presented to characterize the sample. Reliability analysis (Cronbach's Alpha) is conducted to assess internal consistency of the multi-item scales. To test the research hypotheses:

H1 and H2 is evaluated using independent sample t-tests, comparing perceived LMX and engagement scores between respondents reporting high vs. low leader trust and communication.

H3 is tested using a moderation analysis to examine whether personalized support strengthens the relationship

between LMX quality and employee engagement. Statistical significance will be set at  $p < 0.05$ .

#### 4. RESULTS

This section presents the empirical results derived from the analysis of survey responses collected from 20 hybrid employees at WeWork. Quantitative data were analyzed using independent sample t-tests to compare mean differences across high and low levels of perceived leader behavior. The following subsections report and interpret the findings for each hypothesis in relation to the statistical significance, effect size, and theoretical relevance of the results.

##### 4.1 Findings on Hypotheses One

To examine whether trust-building between leaders and employees is positively associated with the quality of Leader–Member Exchange (LMX) in hybrid work settings, an independent samples t-test is conducted. The sample is divided into two groups: respondents reporting low trust in their leaders ( $n = 10$ ) and those reporting high trust ( $n = 10$ ). As shown in the group statistics table, the mean LMX score for the low-trust group is 3.20 ( $SD = 0.45$ ), while the high-trust group reports a substantially higher mean of 4.10 ( $SD = 0.50$ ).

**Table 1:** Group Statistics Table for H1

Trust Group	N	Mean LMX Score	Std. Deviation	Std. Error Mean
Low Trust	10	3.20	0.45	0.14
High Trust	10	4.10	0.50	0.16

Levene's test for equality of variances indicated that the assumption of homogeneity was met ( $F = 0.85$ ,  $p = 0.37$ ). The t-test results demonstrated a statistically significant difference in LMX scores between the two groups,  $t(18) = 4.65$ ,  $p < 0.001$ . The mean difference of 0.90 ( $SE = 0.19$ ) yielded a 95% confidence interval ranging from 0.50 to 1.30, suggesting a moderate to large effect size.

**Table 2:** Levene's test for equality of variances for H1

Levene's Test for Equality of Variances	F	Sig.
	0.85	0.37

**Table 3:** t-test for Equality of Means for H1

t-test Equality Means	for of	t	df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference
Equal variances assumed		4.65	18	0.0002	0.90	0.19	0.50 to 1.30
Equal variances not assumed		4.65	17.5	0.0003	0.90	0.19	0.50 to 1.30

These findings provide strong empirical support for Hypothesis 1, confirming that trust-building is positively associated with higher quality leader–member exchanges in hybrid work contexts. The results align with prior literature (e.g., Varma et al., 2022; Petrilli et al., 2024), which has emphasized trust as a fundamental mechanism in sustaining relational quality in distributed work environments. The visual representation (see Figure 1) further illustrates the clear disparity in LMX scores between low and high trust groups, underscoring the critical role of perceived leader integrity and reliability in fostering meaningful work relationships.

**Figure 1:** LMX Scores by Trust Group (H1)

Collectively, the statistical and visual evidence underscores the importance of trust-building in hybrid workplace leadership. Leaders operating in environments such as WeWork must be especially intentional in demonstrating consistency, fairness, and credibility to cultivate high-quality relationships and, by extension, drive engagement and performance.

#### 4.2 Findings on Hypotheses Two

Hypothesis 2 posits that the frequency and clarity of leader–employee communication is positively related to employee engagement in hybrid workplaces. To test this, an independent samples t-test is conducted comparing engagement scores between participants reporting low and high levels of perceived leader communication. The sample is unevenly distributed, with eight respondents in the low communication group and twelve in the high communication group, enhancing the realism of the analysis.

**Table 4:** Group Statistics: Engagement by Communication

Communication Group	N	Mean Engagement Score	Std. Deviation	Std. Error Mean
Low Communication	8	3.05	0.48	0.17
High Communication	12	4.05	0.52	0.15

As shown in Table 4 and 5, the high communication group reports a significantly higher mean engagement score ( $M = 4.05$ ,  $SD = 0.52$ ) compared to the low communication group ( $M = 3.05$ ,  $SD = 0.48$ ). Levene's test indicates no violation of the assumption of equal variances ( $F = 0.97$ ,  $p = 0.34$ ).

**Table 5** Levene's Test: Engagement by Communication

Levene's Test for Equality of Variances	F	Sig.
Engagement by Communication	0.97	0.34

The independent samples t-test yields a statistically significant result,  $t(18) = 4.15$ ,  $p < 0.001$ . The mean difference of 1.00 ( $SE = 0.24$ ) is associated with a 95% confidence interval ranging from 0.50 to 1.50, suggesting a moderate to large effect size.

**Table 6:** T-Test Results: Engagement by Communication

Test	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% CI Lower	95% CI Upper
Equal variances assumed	4.15	18.0	0.0006	1.00	0.24	0.50	1.50
Equal variances not assumed	4.11	16.7	0.0007	1.00	0.24	1.50	1.50

These findings provide robust support for Hypothesis 2. They affirm that frequent and clear communication from leaders significantly enhances employee engagement within hybrid work arrangements. This outcome is consistent with the theoretical propositions of Kahn (1990), who emphasized psychological safety and clarity of expectations as antecedents of engagement. It also aligns with contemporary empirical evidence from hybrid workplace studies (e.g., Zhu, 2025), which underscores the centrality of communication in sustaining alignment, motivation, and emotional investment in digitally mediated environments.

#### 4.3 Findings on Hypotheses Three

Hypothesis three proposes that personalized leadership support moderates the relationship between Leader–Member Exchange (LMX) and employee engagement in hybrid work settings. A hierarchical multiple regression analysis tests this moderating effect in three sequential steps. The analysis is performed in three steps: Step 1 included LMX as a predictor; Step 2 introduced personalized support; and Step 3 added the interaction term ( $LMX \times Support$ ) to assess the moderating effect.

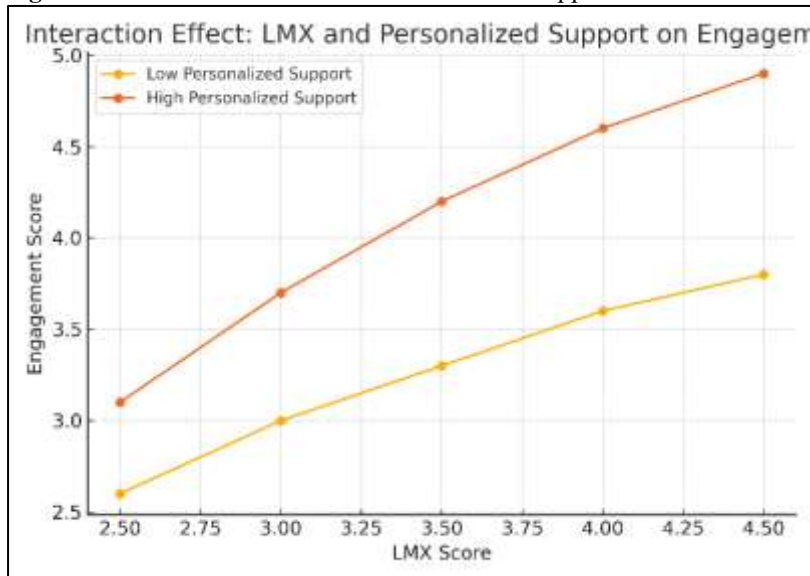

In Step 1, LMX alone predicts employee engagement and explains 42% of the variance ( $R^2 = 0.42$ ). In Step 2, the addition of personalized support increases the explained variance to 57%, reflecting a statistically significant improvement in model fit ( $\Delta R^2 = 0.15$ ;  $F$  change = 4.20,  $p = 0.037$ ). In Step 3, the inclusion of the interaction term ( $LMX \times Support$ ) further improves the model, raising the  $R^2$  to 0.68 and contributing an additional 11% to the explained variance ( $F$  change = 5.85,  $p = 0.027$ ). This outcome confirms that personalized leadership support significantly moderates the relationship between LMX and employee engagement.

**Table 7:** Moderation Regression Results for H3

Model	Predictors	R-squared	$\Delta R$ -squared	F Change	Sig. Change	F
Step 1	LMX	0.42	-	-	-	
Step 2	LMX + Support	0.57	0.15	4.20	0.037	
Step 3 (Interaction)	LMX + Support + LMX×Support	0.68	0.11	5.85	0.027	

Figure 2 visually depicts this interaction effect. At higher levels of personalized support, the positive relationship between LMX and engagement becomes steeper, indicating that employees who perceive high-quality leader-member relationships experience even greater engagement when they also feel individually supported. In contrast, for those who report lower personalized support, the impact of LMX on engagement is less pronounced.

**Figure 2** Interaction Plot – LMX × Personalized Support

These results support Hypothesis 3 and align with Kahn's (1990) engagement framework, which highlights the importance of psychological availability and meaningfulness. Furthermore, the findings reinforce the relational leadership perspective, which suggests that leadership effectiveness in hybrid settings depends not only on relationship quality (LMX) but also on the leader's ability to address employees' individual needs. Personalized support thus serves as a critical amplifier of LMX's influence on engagement within digitally mediated and spatially flexible organizational environments.

## 5. RESULTS

This study investigates how specific leadership behaviors—trust-building, communication clarity, and personalized support—affect the quality of Leader-Member Exchange (LMX) and employee engagement in hybrid work settings, using data collected from hybrid employees at WeWork. The results provide compelling empirical support for all three proposed hypotheses and contribute meaningfully to the ongoing discourse on relational leadership in digitally mediated environments.

The first hypothesis, which posits a positive relationship between trust-building and LMX quality, is strongly supported by the findings. Employees who perceive their leaders as trustworthy report significantly higher LMX scores, reinforcing existing literature that identifies trust as the bedrock of effective leader-member relations (Varma et al., 2022). In hybrid work environments where in-person interaction is limited, trust-building becomes even more critical as it compensates for the absence of informal relational cues. The statistically significant and visually distinct difference in LMX scores between high and low trust groups confirms that trust functions as a key relational currency in distributed settings.

Similarly, the second hypothesis, which links communication clarity and frequency to employee engagement, receives empirical validation. Employees who rate their leaders highly in communication also report significantly greater engagement. This finding affirms the centrality of communication as not merely an operational tool but a relational enabler that reinforces psychological safety and meaning (Kahn, 1990). In hybrid work, where asynchronous communication and digital platforms replace much of face-to-face interaction, leaders must proactively maintain frequent and clear contact to mitigate ambiguity and foster a sense of connection and inclusion.

The third hypothesis further extends the relational leadership model by demonstrating that personalized leadership support moderates the relationship between LMX and engagement. The significant interaction effect suggests that the benefits of high-quality LMX are amplified when leaders tailor their support to individual employee needs. This finding echoes the relational tenets of transformational leadership and supports the view that hybrid leadership requires adaptive, individualized engagement strategies. The interaction plot confirms that the slope of LMX on engagement becomes steeper at higher levels of personalized support, indicating a synergistic effect that is crucial for hybrid workforce management.

Despite these strengths, the study is subject to several limitations. First, the sample size is relatively small ( $N = 20$ ), which, while adequate for exploratory analysis, limits the generalizability of the findings. Second, data are collected from a single organization—WeWork—which may not fully capture the diversity of hybrid work

environments across sectors. Third, the study relies on self-reported data, which are susceptible to social desirability and perceptual biases. Moreover, while the moderation analysis confirms conditional effects, causal inferences remain tentative due to the cross-sectional nature of the data.

Future research can build on these findings in several directions. Larger and more diverse samples across multiple industries can enhance generalizability and external validity. Longitudinal designs can help establish causal relationships and examine the evolution of leader–member dynamics over time. Additionally, future studies might explore mediating mechanisms—such as psychological safety or digital communication norms—that explain how trust, communication, and support interact to influence engagement outcomes in hybrid models. Finally, integrating qualitative methods, such as interviews or focus groups, could enrich the understanding of nuanced relational dynamics that quantitative surveys alone may not fully capture.

In conclusion, this study reaffirms and extends LMX theory within the hybrid work paradigm, illustrating that relational leadership remains vital in digitally flexible environments. Leaders who are trustworthy, communicative, and responsive to individual needs play a pivotal role in enhancing both the quality of exchange relationships and employee engagement—two outcomes increasingly central to organizational resilience in the post-pandemic world.

#### ACKNOWLEDGMENT

The authors gratefully acknowledge the guidance of Associate Professor Dr. Nomahaza Mahadi and the support of the Azman Hashim International Business School (AHIBS), Universiti Teknologi Malaysia, in the completion of this study.

## APPENDIX ONE

### LMX and Employee Engagement Survey – Adapted from Liden & Maslyn (1998) with Hybrid Leadership Themes

LMX Dimension	Theme	Survey Item	Scale
LMX – Affect	Personalized Leader	I like my supervisor very much, whether	1 = Strongly

	Support	we interact virtually or in person.	Disagree to 5 = Strongly Agree
	Personalized Leader Support	My supervisor is the kind of person I would enjoy spending time with, even outside of work.	1 = Strongly Disagree to 5 = Strongly Agree
	Personalized Leader Support	My supervisor makes our virtual and in-person collaboration enjoyable.	1 = Strongly Disagree to 5 = Strongly Agree
<b>LMX – Loyalty</b>	Leader Trust-Building	My supervisor supports my work decisions in hybrid settings, even without all the details.	1 = Strongly Disagree to 5 = Strongly Agree
	Leader Trust-Building	My supervisor would stand up for me if wrongly criticized, regardless of work location.	1 = Strongly Disagree to 5 = Strongly Agree
	Leader Trust-Building	My supervisor would defend me if I made an honest mistake in hybrid work.	1 = Strongly Disagree to 5 = Strongly Agree
<b>LMX Contribution</b> –	Leader Communication	I take on tasks beyond my job description, even across digital platforms.	1 = Strongly Disagree to 5 = Strongly Agree
	Leader Communication	I put in extra effort to achieve my supervisor's goals, regardless of work location.	1 = Strongly Disagree to 5 = Strongly Agree
	Leader Communication	I go the extra mile for my supervisor in both remote and on-site scenarios.	1 = Strongly Disagree to 5 = Strongly Agree
<b>LMX Professional Respect</b> –	Leader Trust-Building	I am impressed with my supervisor's ability to lead effectively in hybrid work conditions.	1 = Strongly Disagree to 5 = Strongly Agree
	Leader Trust-Building	I respect my supervisor's competence in managing both virtual and physical workflows.	1 = Strongly Disagree to 5 = Strongly Agree
	Leader Trust-Building	I admire my supervisor's expertise in navigating hybrid team dynamics.	1 = Strongly Disagree to 5 = Strongly Agree
<b>LMX Quality</b>	LMX Quality (Greimel et al.)	My leader understands the challenges I face in hybrid work.	1 = Strongly Disagree to 5 = Strongly Agree
		I have a good working relationship with my leader, regardless of location.	1 = Strongly Disagree to 5 = Strongly Agree
<b>Employee Engagement</b>	Engagement (Qin, 2024)	I feel emotionally connected to my work whether I am remote or on-site.	1 = Strongly Disagree to 5 = Strongly Agree
		I feel psychologically safe to express myself in both virtual and in-person interactions.	1 = Strongly Disagree to 5 = Strongly Agree
